

Joint unseen-SNR / held-out-combination contrast

TECHNICAL PILOT; not confirmatory. Equal-case AUROCs are transformed within checkpoint, then same-seed strategy differences are averaged. Squares: patient-cluster percentile 95% CIs conditional on fixed checkpoints/noise. Circles: paired training-seed t 95% CIs; these are different uncertainties, not a joint interval. Only available pilot unseen SNRs enter; n=1, no training CI or confirmatory p value.

■ Patient-cluster 95% CI (fixed checkpoints)
